Abstract

A new genus, *Acabyara*, and a new species, *A. aruama*, are described from Brazil (Amazonas, Rondonia) and Colombia (Amazonas). A key to the genera of Pteroplatini is provided.

Key words: Cerambycinae, key to genera, Pteroplatini, new genus, South America

Resumo. Um novo gênero, *Acabyara*, e uma nova espécie, *A. aruama*, são descritos do Brasil (Amazonas, Rondônia) e Colômbia (Amazonas). Chave para os gêneros de Pteroplatini é fornecida.

Palavras-chave: América do Sul, Cerambycinae, chave para gêneros, novo gênero, Pteroplatini

Introduction

Pteroplatini Thomson, 1860 is a small tribe of Neotropical Cerambycinae presently comprising seven genera (Monné 2005) that can be separated in two groups. One of them, including the genera *Cosmoplatus* Aurivillius, 1891, *Cosmoplatidius* Gounelle, 1911, and *Deltosoma* Thomson, 1864, has the prothorax as wide or almost as wide at base as elytra, carinate antennae, and cylindrical femora; the other, with prothorax much narrower at base than elytra, non-carinate antennae and clavate femora, includes *Pteroplatus* Buquet, 1840, *Thelgetra* Thomson, 1864, *Aphylax* Lacordaire, 1869 and *Corynellus* Bates, 1885. The new genus described below belongs in the first group.

The types are deposited at the Museu Nacional, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil (MNRJ), and Museu de Zoologia, Universidade de São Paulo, São Paulo, Brazil (MZSP).
