Abstract

Australia possesses a rich fauna of leptocheliid tanaidaceans (Crustacea: Tanaidacea: Leptocheliidae), including many species that currently remain undescribed. As an addition to the 13 leptocheliid species known to date from Australian waters, a new genus (*Poorea* n. gen.) and five new species collected from shallow macrophyte habitats are diagnosed (*Parakonarus robertsoni* n. sp., *Leptocheilia evansi* n. sp., *Leptocheilia gadgeti* n. sp., *Poorea wrighti* n. sp. and *Poorea johannesi* n. sp.). *Leptocheilia nobbi* is transferred to the genus *Poorea*, *Leptocheilia fairgo* to *Parakonarus*, and a redescription provided for the enigmatic tanaidacean *Leptocheilia ignota* on the basis of specimens collected near the Sydney type locality. A key is provided to Australian leptocheliid species.
