Abstract

New species of the *Scirtes flavoguttatus* species-group are described from SE Asia. Altogether 34 species are newly described, including *Scirtes beccus sp. nov.* (Malaysia), *S. bocakorum sp. nov.* (Indonesia), *S. crockerensis sp. nov.* (Malaysia), *S. decorus sp. nov.* (Malaysia), *S. dumogensis sp. nov.* (Indonesia), *S. gunongmulensis sp. nov.* (Malaysia), *S. ishikawai sp. nov.* (Vietnam), *S. kinabalensis sp. nov.* (Malaysia), *S. kundasangensis sp. nov.* (Malaysia), *S. lambriensis sp. nov.* (Indonesia), *S. leuserensis sp. nov.* (Indonesia), *S. luteus sp. nov.* (Malaysia), *S. malaisei sp. nov.* (Myanmar), *S. melinauensis sp. nov.* (Malaysia), *S. noonadan sp. nov.* (Philippines), *S. pallicolor sp. nov.* (Malaysia), *S. penampangensis sp. nov.* (Malaysia), *S. phoupanensis sp. nov.* (Laos), *S. prodigiosus sp. nov.* (Malaysia), *S. punctatus sp. nov.* (Philippines), *S. quasibaleensis sp. nov.* (Malaysia), *S. ranauensis sp. nov.* (Malaysia), *S. sarawakensis sp. nov.* (Malaysia), *S. seblatensis sp. nov.* (Indonesia), *S. sibayensis sp. nov.* (Indonesia), *S. sibolangitensis sp. nov.* (Indonesia), *S. sulawescicus sp. nov.* (Indonesia), *S. sulcigeroides sp. nov.* (Malaysia), *S. talinensis sp. nov.* (Philippines), *S. ulukimanensis sp. nov.* (Malaysia), *S. velutinus sp. nov.* (Malaysia), *S. vietnamicus sp. nov.* (Vietnam), *S. wallacei sp. nov.* (Indonesia), *S. yangsinensis sp. nov.* (Vietnam). New localities of six species are provided. An updated identification key, checklist and a summary of distributional data are included. Probability of the occurrence of the *Scirtes flavoguttatus* species-group was evaluated with an analysis in MaxEnt software. It is highly plausible that members of the group occur in most mountainous rainforests of SE Asia.

Key words: Marsh beetles, new species, identification key, checklist, distribution modeling

Introduction

The *flavoguttatus* group is a diverse species group of the genus *Scirtes* restricted to SE Asia. The best character defining the *flavoguttatus* group is a derived aedeagus consisting of penis (narrow, often club-like) fused with apical portion of U-shaped tegmen, which can be either symmetrical or asymmetrical, often with large, hook-like or spine-like parameres. Members of the *Scirtes flavoguttatus* species-group are often brightly colored, and elytral excitators are present in females of numerous species. Sexes can differ considerably in coloration (e.g. males of *Scirtes laosensis* Yoshitomi & Ruta have contrasting yellow and black elytral pattern, whereas females have uniformly brownish-black elytra).

The *flavoguttatus* group of *Scirtes* was revised by Yoshitomi & Ruta (2010), and three new species were described by Klausnitzer (2013). Since publication of the revision numerous unidentified specimens were found in several collections which included a considerable number of undescribed species. In the present paper we describe new species, report new localities of previously described taxa, and provide an updated checklist and identification key. Records are mapped and distribution is discussed.

Material and methods

In order to study genitalia, dried specimens were placed in water for ca. 6–12 hours; then abdomens were removed and transferred to 10% NaOH solution. After 2–4 hours, genitalia were removed, washed in distilled water and transferred into glycerin (female genitalia) or gum-chloral (Swann's) medium (male genitalia). Female genitalia were additionally placed in a glycerin solution of chlorazol black to stain membranous structures. Genitalia were observed, measured and photographed on slides under a Nikon Eclipse Ni compound microscope. After taking photographs, genitalia were removed from slides, washed in distilled water and glued on cardboards with a water solution of polyvinyl alcohol. Photographs were executed on a Nikon D5100 digital camera in combination with a compound or dissecting microscope (Nikon SMZ 1500). Images were generated using Helicon Focus 5.3.14 software and enhanced using Photoshop® CS4.

Total length was measured from above and extends from the anterior edge of pronotum to the apex of elytra. Head length was measured from the anterior edge of clypeus to the posterior edge of head. Elytra length was measured along the suture from the base of the scutellum to the apex. The shape of the pronotum is described when observed in perpendicular view. The following abbreviations are employed: L—length, W—width, TL—total length, EW—elytral width, EL—elytral length, PW—pronotal width, PL—pronotal length.

www.synthesys.info/). Studies of Rafał Ruta were partly sponsored by the University of Wrocław (grant 2126/M/KBTE/14). Research of Hiroyuki Yoshitomi is supported by KAKENHI (24405028; head investigator: S. Okajima). María Laura Libonatti (Buenos Aires, Argentina), and Peter Zwick (Schlitz, Germany) are deeply thanked for their important corrections of the previous version of the manuscript.
